

## CASE REPORT

Radiofrequent electrosurgery - **LLETZ** (Large Loop Excision of the Transformation Zone) and **LOOP** (Loop Electrosurgical Excision Procedure) are electrosurgical procedures used to remove a portion of cervical tissue.

Report of Ass. Dr Dušan Simić

Device: RWSU Expert

Aesthetic procedure done under local anesthesia on female with photo documentation before intervention.

**BEFORE**

Doctors comments : It was observed that here was almost no scarring or tissue discoloration on post-op check, and healing process resulted in almost no visual recognition of performed intervention after 30 days. Great patient satisfaction achieved. Unfortunately, we do not have pictures of the patient after the intervention and control, because she didn't want to take pictures of the operated part.
